

Tutorial 43

The code defence

Advanced Corporate Finance (EBM232A05)

University of Groningen

- Every team: a $\approx$ 5-minute walkthrough of its own repository, then 1–2 questions drawn at random from the bank.
- Every member must be able to speak to every part of the team's work — the schedule and order are on the board.
- This is assessment moment M4: your individual reflections (D3b, due at the start of this week) are graded with it.

The defence adds no points. It gates them — explained on the next slide, exactly as in the project brief since week 36.

What the defence does (and does not do)

- A confident, correct defence **removes the cap** — it does not raise your score above the rubric. It is a fraud gate, not a bonus round.
- A team that **cannot explain its own submission**: process scores (D1b, D2b, D3a, D4) **capped at 50%**.
- A member who cannot speak to work their **reflection** claims: that reflection re-graded individually; inconsistency with the dossier triggers an integrity review.
- You cannot defend what you did not do — **which is the point**, and why an honest team has nothing to prepare beyond knowing its own work.

What a strong five minutes looks like

- **The tour:** README → *run_all* → the funnel (universe to final *N*, filter by filter) → the target table, regenerated live if asked.
- **One catch, told properly:** where the AI was wrong, the transcript line where you saw it, the commit that fixed it, and what the target cell did.
- **Honesty about the misses:** a cell outside the band with a root-caused explanation beats a suspiciously perfect table — the harness has already told us which is which.

Weak five minutes, for contrast: reading the README aloud; “the AI did this part”; a tour that avoids the one folder the questions will go to.

The questions

Drawn at random, one or two per team — the bank includes, per paper:

- **Show us** where the funnel drops from X to Y firms, and why.
- **Change** this winsorization / filter and tell us which target cell moves most — your sensitivity table already knows.
- **Explain this commit** — what changed, why, and what it did to the numbers.
- **Your extension**: why this axis, and what did the result say about the paper's claim?

Any member may be asked any question. Live manipulation of your own code is fair game — it is the cleanest proof of ownership there is.

After today

- **What remains: the exam** (80% — digital, open questions, closed book, non-programmable calculator). Dates and location on Ocasys.
- **Your revision sheet**: the completed frictions ledger — Problem set 42, P6(d) — all seven weeks in one table. The exam's calculation drills are the problem sets' P2s; the interpretation items are their P4s.
- **The mock exam** (posted week 39) is the calibration; the problem-set keys are the method.

The whole course in one line: value is the benchmark, minus the frictions we named one by one.
